

February 9, 2022

Dear Neighbor,

Kerr McGee Oil & Gas Onshore, LP, a subsidiary of Oxy USA Inc, is preparing to submit an application for a Weld County Oil and Gas Location Assessment (WOGLA) for a project in your community. We are committed to being good neighbors by providing frequent and transparent information, seeking the community's feedback, safeguarding the environment, and protecting the health and safety of employees and communities.

Description of the project

The proposed REI 6-5HZ project, as described in the following pages in more detail, consists of fourteen oil and natural gas wells and a production facility. The timeline for development is based on obtaining the required permits and drilling rig availability. At this time, we estimate that drilling will start sometime between July and September 2023. However, we commit to keeping you updated throughout the permitting process and providing a detailed timeline before beginning construction. You can find project updates at oxycoloradostakeholder.com/project-updates.

Standard practices and mitigation strategies

Our standard practices align with the guidelines of the Colorado Oil and Gas Conservation Commission (COGCC) and the Colorado Department of Public Health and Environment. In addition, we carefully planned the development and mitigation techniques for this location to ensure the temporary impacts are minimized as much as possible.

Our team members will continue to work diligently to plan construction and operations with you in mind. We welcome your feedback and can be contacted at any time for questions and comments by email, phone, or mail. In addition, we will consider all reasonable mitigation measures proposed to minimize adverse impacts of the proposed oil and gas location.

Next steps

This project must undergo a comprehensive permitting process at both the local and state level. We will keep our website updated, and you will be notified by mail at many steps throughout the process. Please reach out to us or Weld County to discuss this project or to set up a meeting. We look forward to working with you.

Our Commitment To You

Our Best Practices and Mitigation Measures

Traffic Management Plan

One part of the comprehensive permitting process is developing a traffic management plan. This includes specific routes for all traffic coming to and leaving the proposed project locations. To access the locations, drivers will use County Road 38 and County Road 39. Speed limits will be reduced to 10 mph on the access road and 5 mph once vehicles reach the well pad/facility.

We reduce traffic as much as possible through oil transfer and Water-On-Demand systems. The oil produced is transported off-site through a pipeline. In addition, we transport the water used in hydraulic fracturing through our innovative Water-On-Demand pipeline system to reduce traffic further. Since its inception in 2012, this system has enabled us to eliminate 60 million miles of truck traffic from Weld County roads. Doing so has reduced emissions, dust, road wear, and inconvenience to our neighbors. This system also reduces our surface footprint by eliminating water storage tanks.

REI 6-5HZ Well Pad and Facility – Proposed Haul Routes

Weld County, Colorado

Phases of Energy Development

For more information, please see www.OxyColoradoStakeholder.com/Oil-and-Gas-101

1 Pad Construction 30-45 days per pad

Standard construction equipment prepares the well site. A wall may be installed to reduce or minimize noise and light during development.

2 Surface Casing Set 1-2 days per well

A drilling rig begins the underground construction process by installing steel pipe and cement (surface casing) to protect groundwater. Surface casing is set at least 50' below the aquifer, which is typically about 1,000' below the surface.

3 Horizontal Drilling 4-6 days per well

A production rig arrives and drills to a depth of 7,000 to 8,000 feet. The horizontal portion of the wellbore can extend more than two miles.

Additional layers of protective steel casing and cement are installed.

4 Well Completions: 3 Components 6-9 days per well

Hydraulic Fracturing: a safe, highly engineered technology developed in the 1940s. Fracturing fluid is pumped under high pressure down the wellbore to create hairline fractures in the rocks over a mile below the earth's surface.

Flowback: After fracturing, the wells are opened and oil and gas flows into the mobile production facility.

Well clean-out and Tubing: We clean-out the wells to remove excess sand and install the production tubing.

5 Production Facility Construction 30-45 days per facility

Production facilities are constructed adjacent to the wells to collect and separate the oil, natural gas and water that are produced. Facility production is 30-45 days of work done in stages over a period of about four months.

6 Reclaim Well Site 30 days per pad

Once development phases are complete, the pad is reclaimed to the largest extent possible to match the existing landscape. Each well will produce energy vital to the health and welfare of our communities or decades to come.
